# 1. Manifesto: The Truth Behind the Clientelist Network.

## 1.1 The Hijacking of the Narrative.

Today, journalism has ceased to be the "fourth estate" and has become the public relations department for global institutions. We live in a mafia-like clientelist network where truth has been replaced by convenience.

- **Subsidies as a Muzzle:** Institutions inject capital into media outlets under the guise of "aid," but with a clear objective: total control of the narrative. A medium that depends on public money or large corporations cannot afford to bite the hand that feeds it.
- **Media Extortion:** A corrupt symbiosis has been created where media outlets use their reach to extort institutions and companies, demanding advertising guidelines in exchange for not attacking their interests.

## 1.2 The 2030 Agenda and Single Thought.

Under the umbrella of the 2030 Agenda, a "single thought" is being imposed that does not allow for debate. Any dissenting voice is labeled, censored, or demonetized. Free journalism has died on the centralized servers of Big Tech.

## 1.3 Our Response: NOAGENDA Media.

NOAGENDA Media is born as an informational insurgency. We do not ask for permission to publish and we do not depend on subsidies that compromise our integrity.

- **Financial Independence:** We are funded directly through our community and the economic flow of our token. Every exchange between users feeds the infrastructure that sustains the truth.
- **Immutability by Design:** Thanks to the "Permaweb," our articles do not reside on a server that a government can shut down. Once sealed, the data is eternal, unerasable, and resistant to censorship.
- **Reader Sovereignty:** Here, the holder is not just an investor; they are a guardian of information. Their support grants them voice and vote in the deepest debate zones of our ecosystem.

## 1.4 The Social Contract of NOAGENDA.

To ensure this ecosystem is fair, transparent, and resistant to the corruption we criticize, we have encoded our ethics directly into the blockchain:

- **Ethical Fee Ceiling:** The economic structure is based on a fixed and honest contribution. The sum of buy and sell fees is set at a total of 5%, a margin designed exclusively for the medium's sustainability. By code, these fees can never exceed 5%, eliminating any possibility of abuse or manipulation by the administration.

- **Security and Growth Fund (SGF):** Every transaction feeds the SGF, the operational heart of our resistance.
- **Security:** Bolstering technical infrastructure, maintaining IPFS nodes, and protecting the platform against censorship or institutional cyberattacks.
- **Growth:** Financing high-impact content creation, independent investigations, and the expansion of our omnichain network.

## 1.5 Manifesto Conclusion.

NOAGENDA Media is not just a magazine; it is a protocol for freedom. While traditional media sink into the mud of subsidies and mafia networks, we build on the immutability of code. We are not part of their agenda. We are the chronicle of their end.

## 2. Content Ecosystem: The Eternal Archive.

### 2.1 Permanent Storage on Arweave.

Unlike traditional servers, we use Arweave technology. Every article or investigation is uploaded to the "Permaweb".

- **Lifetime Sealing:** Through a single payment, content is recorded immutably.
- **State Censorship Resistance:** As it does not depend on a central server, there is no single point of failure. Once published, it is technically impossible to erase it from history.

### 2.2 Token-Gating: The Community Key.

To protect the integrity of debates, we implement a Token-Gating system.

- **Digital Identity Validation:** Accessing sensitive areas does not require personal data; the user simply links their Web3 wallet (MetaMask, Trust Wallet, etc.).
- **Ownership Verification:** The platform verifies token holdings in real-time across compatible networks (BSC, Polygon, Base). If the user holds the minimum balance, interaction privileges are unlocked.
- **Shield Against Sabotage:** This acts as a filter against institutional bots, paid trolls, and spam.

## 2.3 Omnichain Technology: Freedom Without Borders.

Thanks to LayerZero technology, our token can "travel" fluently between networks like BSC, Polygon, or Base.

- **Freedom of Choice:** You decide which network to operate on based on speed or gas fees.
- **Unified Global Supply:** The total supply remains the same across all chains; value simply shifts where the community needs it.
- **Fragmentation Resistance:** Being on multiple networks makes the project harder to attack or block.
- **SGF Efficiency:** Allows the fund to collect fees independently on each network.

# 3. Tokenomics: Financial Architecture of the Resistance.

## 3.1 Supply Distribution.

- **35% - Presale and Network Security:** For initial funding and safety reserves.
- **60% - Liquidity and Listings (Scheduled Vesting):** Subject to a strict calendar to protect holders from dilution:
  - **Initial Lock:** Totally locked until the 5th day after launch.
  - **Gradual Release:** 10% monthly for 10 months.
- **5% - Creator Reserve (2-Year Lock):** Team tokens are locked for 2 years to ensure long-term commitment.

## 3.2 Hardcoded Fee Policy.

The smart contract has the following rules "burned" into it:

- **Total Fees:** 5% (2% buy / 3% sell).
- **Destination:** 20% to auto-liquidity and 80% to the SGF.
- **Maximum Limit:** The code technically prevents these fees from ever exceeding 5% (buy fee + sell fee  $\leq 5$ ).
- **Transfers:** Transfers between wallets are not taxed, you only have to pay the gas of the network to move tokens.
- **Bridge:** When available, our Layer Zero bridge will not be taxed by our token, you will only have to pay the external tax of LZ. The maximum amount of the bridge are 100 M tokens, and decimals are restricted to 6.

## 3.3 Technical Security

We use tools like PinkLock for public and verifiable audits of all token locks.

## 4. Security, Autonomy, and Governance.

The Ownership of the smart contracts is protected with a hot-cold multisig wallets system.

### 4.1 Auto-Liquidity.

The smart contract automatically destines 20% of the collected fees (from the total 5%) to feed the Liquidity Pool. This generates an ever-solid price "floor" and reduces volatility. Those LP tokens are locked into the Vault contract forever and no one, even the owner, can recover them.

### 4.2 Legal Structure and Personal Sovereignty.

The project is backed by a legally constituted **sole proprietorship** to manage copyright and physical contracts while maintaining separation from the decentralized ecosystem.

### 4.3 Leadership and Anonymity: Jack Noagenda.

The founder operates under the pseudonym **Jack Noagenda** as a strategic security measure:

- **Protection against Repression:** To avoid personal coercion or

direct attacks due to the platform's anti-system tone.

- **The Message over the Individual:** Importance resides in the immutable information, not in a personalist figure.

## 5. Roadmap: From Disruption to Permanence.

### Phase 1: Awakening and Infrastructure (Q1 - Q2).

- Official Smart Contract deployment with 5% fees and Auto-Liquidity.
- Web 1.0 Platform launch with Token-Gating.
- Activation of the Permaweb (Arweave).

### Phase 2: Omnichain Expansion (Q3 - Q4).

- LayerZero integration for free value flow.
- Multi-network conquest (operating on 3 networks).
- SGF growth and vault synchronization.

### Phase 3: Open Future and Digital Insurgency.

- Evolution into a decentralized social network.
- Independent News Agency funded exclusively by the SGF.
- Expanded Governance for community decision-making.

**Conclusion:** NOAGENDA Media is a living organism. The code is written, the server is ready, and the narrative no longer belongs to them.
